# ATHIMOS
## CLINICAL INFORMATION SYSTEM

## ABOUT US

The company WW8 Technologies was founded in 2009, in Brazil, by a group of professionals who have been working in the health sector for more than 25 years.

Composed of medical specialists who for many years have used systems that are poor suited to their needs and by software specialists who working in the elaboration of systems for the health area, identified the need for the development of a modern and robust system dedicated exclusively to the medical-assistance area.

## OUR SOLUTION

**ATHIMOS is an advanced Clinical Information System aimed at healthcare facilities that persue the evolution of medical-care quality, with the best existing resources for a complete health record, involving not only medical, but also all other information related to patient care. With outstanding usability and adaptability to the establishment environment and practices, it facilitates the engagement of the health care team, resulting in visible gains in performance, quality and safety.**

## WHY CHOOSE ATHIMOS

The bad **user experience** that physicians, nurses and all healthcare team are used to, come from the origin of the most of softwares available to this professionals. Usually those softwares were created initially covering management and operational functions of the healthcare facilities. Being extended to clinical sectors after.

**Athimos®** was created exclusively for those professionals directly involved on the patient care. That's why all resources could be designed by the clinical reasoning.

Many **clinical decision support** features are scattered throughout the system helping the professionals to pay attention in those important details on the clinical situation of the patients.

While the charts are filled, lab results came, orders are prescribed and another dozens of actions like that happen, our exclusive **patient monitoring engine** automatically detects when specific clinical characteristcs combine with each other and put the patient in a guideline/protocol to special cares and standard procedures.

**Athimos®** is very **flexible**, so each healthcare facility can have their own clinical standards, forms, vital signs, order entries, etc. Hundreds of parameters and configurations allows that the system works as the institution determines.

## VALIDATION IN BRAZIL

### B2B

**1 hospital**
- **250** beds
- **80** ambulatory rooms
- **3000** users
- **15k** documents per day

**4 multidisciplinary clinic**

**2 homecare services**
